

Operational Runbook: Aurionpro User Migration & Status Update

1. Document Overview

This runbook provides step-by-step operational instructions for executing the Migration processes into the Aurionpro system. It is designed for Business Unit (BU) operators and IT administrators to ensure safe, repeatable, and traceable data loads.

2. Prerequisites & Environment Setup SSO Migration

Owner: Business Unit (BU) Team | **Timing:** Before uploading any migration payload

Check	Task	Description / Action Required
[]	Environment Check	Confirm read/write access to the Source, Destination folders.
[]	Tracker Verification	Open migration_tracker.csv to find the last used sequence number. Close it immediately after checking so the script is not locked out.
[]	File Naming	Ensure the file is named exactly User_Migration_Batch_{Sequence}.csv using the <i>next</i> available zero-padded sequence (e.g., ..._Batch_00005.csv).

[]	Mandatory Columns	Verify all headers match the Data Dictionary exactly (e.g., firstname, loginid, cifnumber, noOfLoginAttempts).
[]	Date Formatting	Confirm all date columns (e.g., effectivefrom, lastPasswordChangeOn) are strictly formatted as dd/mm/yy. Confirm + is added for the mobile number.
[N/A]	Initial Status Set	If users are to be created as inactive, verify the accountStatus column is populated with UC.
[]	Data Cleansing	Ensure there are no trailing spaces in critical fields like loginid or cifnumber.

3. SSO Migration Execution & Monitoring Checklist

Owner: IT Operator / Admin | **Timing:** During the script run

Check	Task	Description / Action Required
[]	Upload File	Place the validated CSV file into the designated Source folder.

[]	Trigger Script	Allow the automated scheduler to pick it up, or execute manually via python run_migration.py.
[]	Log Verification	Open the Logs folder and confirm a new .log file matching the batch name has been created.
[]	Live Monitoring	Open the log file and verify that [SUCCESS] or [FAILED] transaction blocks are actively generating without system crash errors.

4. SSO Post-Migration Verification Checklist

Owner: IT Operator / Admin | **Timing:** Immediately after the migration script finishes

Check	Task	Description / Action Required
[]	Success File Check	Check the Destination folder for User_Migration_Batch_{Sequence}_Success.csv.
[]	UUIDs Secured	Verify that the Success file contains the newly generated uuid column (required for future status updates).

[]	Error File Check	Look for User_Migration_Batch_{Sequence}_Error.csv. If present, proceed to the Error Remediation Checklist.
[]	Tracker Updated	Open migration_tracker.csv and verify the batch is logged with the correct "Total Migrated" and "Total Failed" counts.
[]	File moving	Rename the success file " CorporateUser.csv " and place it in the aurionpro source folder.

6. SSO Error Remediation Workflow

If an _Error.csv file is generated in the Destination folder, follow this standard operating procedure to rectify the data.

1. **Download & Analyze:** Download User_Migration_Batch_{Sequence}_Error.csv. Scroll to the far right columns to read the ErrorCode and ErrorDescription.
2. **Consult Error Dictionary:**

Error Code	Meaning	Action Required
ERR_001	Missing Mandatory Field	Fill in the missing data (e.g., loginid) in the affected rows.

ERR_003	Invalid Status / Type	Correct isCorpUser or accountStatus values to match acceptable system inputs.
ERR_004	Duplicate Login ID	Change the loginid to a unique value; the user already exists.
ERR_006	Invalid Date Format	Fix dates to ensure they strictly follow dd/mm/yy.

3. **Rectify Data:** Correct the errors directly within the CSV file. **Remove the ErrorCode and ErrorDescription columns** once fixed.
4. **Rename & Re-upload:** Save the file with the **next available sequence number** (e.g., if Batch 00004 failed, save the corrected file as Batch 00005). Upload it to the Source folder and re-run the process.

7. Aurintpro Prerequisites & Environment Setup Migration

Owner: Business Unit (BU) Team | **Timing:** Before uploading any migration payload

Check	Task	Description / Action Required

[]	Success File Check	Place the validated CSV file into the designated Source folder.
-----	---------------------------	---

8. Aurintpro Migration Execution & Monitoring Checklist

Owner: Business Unit (BU) Team | **Timing:** Before uploading any migration payload

Check	Task	Description / Action Required

9. Aurintpro Post-Migration Verification Checklist

Owner: Business Unit (BU) Team | **Timing:** Before uploading any migration payload

Check	Task	Description / Action Required

10. Troubleshooting FAQ

Q: I dropped the file in the Source folder, but nothing is happening.

- *Action:* Check the migration_tracker.csv. If the sequence number of your file is already logged as executed, the script is ignoring it. Rename your file to the next available sequence.

Q: All users failed with ERR_006 (Invalid Date Format).

- *Action:* Check your Excel/CSV export settings. Excel often auto-formats dates. Ensure the raw text data is strictly dd/mm/yy before saving.

Q: The status update script says "User Not Found".

- *Action:* Verify that you are using the system-generated UUID from the _Success.csv file, not the loginid or cifnumber.

Q: The script crashed and no logs were generated.

- *Action:* Verify folder permissions. The system account running the Python script must have Write access to the Logs and Destination directories. Check the primary system event viewer or Cron logs for permission denied errors.
